Multidisciplinary Motivation

3 Intro & Context

Methodology

Results

Wrap Up

- ▶ Students exercise *agency* in course selection beyond their declared major
- ▶ Cross-departmental enrollment signals overlap between programs
- ▶ NSF identifies convergence research as a top 10 BIG Idea: grand challenges “will not be solved by one discipline alone”
- ▶ Interdisciplinary programs can broaden participation for students with marginalized identities

What is MIDFIELD?

4 Intro & Context

Methodology

Results

Wrap Up

- ▶ Multiple-Institution Database for Investigating Engineering Longitudinal Development
- ▶ Academic records of 98,000+ students from 18 US universities
- ▶ Data from 2000 onward to reflect contemporary curricula
- ▶ Contains: degree records, course enrollment, grades, demographics

- ▶ Shift unit of analysis from *student pathways* to *program relationships*
- ▶ Student enrollment as expression of agency and interdisciplinary interest
- ▶ Complementary similarity metrics applied to enrollment vectors
- ▶ Define three interpretable relationship types:
 - ▶ **Nested**: one program's coursework is largely contained within another
 - ▶ **Parallel**: shared base, divergent specialization
 - ▶ **Convergent**: deep overlap in both general and specialized content
- ▶ Extend curricular analytics *across* disciplinary boundaries

RQ: What types of curricular relationships have emerged between undergraduate STEM programs as evidenced by student enrollment patterns?

From Student Records to Program Vectors

Intro & Context

8 Methodology

Results

Wrap Up

1. Identify all courses taken by students completing each CIP code
2. Count course frequencies across all graduates of that major
3. Result: a high-dimensional *enrollment vector* per program
4. Apply similarity metrics to compare vectors pairwise

Why Multiple Metrics?

Intro & Context

9 Methodology

Results

Wrap Up

- ▶ A single metric cannot distinguish:
 - ▶ Broad gen-ed overlap vs. specialized content overlap
 - ▶ Subset containment vs. symmetric overlap
 - ▶ Expected vs. statistically surprising co-enrollment

Jaccard Index (Curricular Width)

$$J(A, B) = \frac{|A \cap B|}{|A \cup B|}$$

How much total curricular territory do two programs share?

- ▶ Treats every course equally
- ▶ Diluted by rare electives in large programs

Intro & Context

10 Methodology

Results

Wrap Up

TF-IDF Cosine (Specialized Identity)

Intro & Context

11 Methodology

Results

Wrap Up

Do two programs share identity-defining coursework?

- ▶ Weights use TF-IDF: upweights courses unique to few programs; downweights ubiquitous ones
- ▶ Resistant to program size differences
- ▶ Isolates specialized content from gen-ed noise

$$\cos(\vec{a}, \vec{b}) = \frac{\vec{a} \cdot \vec{b}}{|\vec{a}| |\vec{b}|}$$

Overlap Coefficient (Subset Detection)

Overlap $\approx 80\%$
Jaccard $\approx 8.5\%$

Is one program's curriculum largely a subset of another's?

- ▶ Divides by the *smaller* set
- ▶ High Overlap + Low Jaccard = **nested**

$$\text{Overlap}(A, B) = \frac{|A \cap B|}{\min(|A|, |B|)}$$

Intro & Context

12 Methodology

Results

Wrap Up

PMI (Signature Bonds)

Intro & Context

13 Methodology

Results

Wrap Up

Expected

Observed

Do two programs share statistically surprising courses?

- ▶ Compares observed co-occurrence to expected
- ▶ High PMI = courses that “belong together”

$$\text{PMI}(m, c) = \log \frac{p(m, c)}{p(m) p(c)}$$

Kulczynski (Mutual Resemblance)

How well would a student from one program fit in the other?

- ▶ Averages overlap from each perspective
- ▶ Robust for large vs. small programs

$$\text{Kulc}(A, B) = \frac{1}{2} \left(\frac{|A \cap B|}{|A|} + \frac{|A \cap B|}{|B|} \right)$$

Intro & Context

14 Methodology

Results

Wrap Up

Table: Metric signatures for three curricular relationship types

Type	Jaccard	TF-IDF	Overlap	PMI	Example
Nested	Low	Low	High	Var.	$IT \subset CS$
Parallel	Med	Low	Med	Low	$EE \parallel \text{Civil Eng}$
Convergent	High	High	High	High	$\text{Aero} \approx \text{Ind Eng}$

- ▶ The *pattern* across metrics defines the relationship, not any single score
- ▶ Relative values within a domain matter more than absolute percentages

STEM Overview: Mathematics as a Bridge

Intro & Context

Methodology

17 Results

Wrap Up

**STEM Branches : Jaccard
(Curricular Width)**

- ▶ Math shares coursework with Mech Eng (~36%), Physics (~23%), CS (~21%)
- ▶ *Generalist connector* across STEM
- ▶ Validates the approach

STEM Overview: Nested Patterns Emerge

Intro & Context

Methodology

18 Results

Wrap Up

- ▶ Physics–Mech Eng: ~65% Overlap vs. ~20% Jaccard
- ▶ High Overlap + Low Jaccard = **nested** relationship
- ▶ Physics coursework is largely contained within Mech Eng
- ▶ A single metric would miss this asymmetry

Engineering: The Parallel Pattern

Intro & Context

Methodology

19 Results

Wrap Up

- ▶ Median TF-IDF across engineering: ~3%
- ▶ Engineering programs share a large common core...
- ▶ ... but specialized content is very different
- ▶ This is the **parallel** pattern: shared base, divergent identity
- ▶ Exception: EE–CompE share ~33% Jaccard + high TF-IDF (merged departments)

Engineering: Aerospace–Industrial Convergence

Intro & Context

Methodology

20 Results

Wrap Up

- ▶ **Flagship result:** Aero–Industrial scores highest on every metric:

- ▶ TF-IDF ~45%, Jaccard ~47%
- ▶ Kulczynski ~66%, Overlap ~79%

- ▶ Textbook **convergent** relationship
- ▶ No one groups these administratively

Sciences: Cross-CIP Clustering

Intro & Context

Methodology

21 Results

Wrap Up

- ▶ Animal Sci (CIP 01) clusters with Biochemistry & Animal Bio (CIP 26)
- ▶ Strongest PMI: Animal Sci–Biochem (~23%)
- ▶ Crosses CIP family boundaries
- ▶ Math–Chem TF-IDF (~49%): strongest specialized pair

Computing: The Nested Hierarchy

Intro & Context

Methodology

22 Results

Wrap Up

- ▶ IT–CS: **cleanest nested example** in the dataset
 - ▶ Overlap: ~80%
 - ▶ Jaccard: ~8.5%
 - ▶ Largest divergence between these metrics anywhere
- ▶ CS–CompE: mixed nested/convergent (Overlap ~52%, TF-IDF ~29%)
- ▶ Computing is organized as *nested hierarchies* branching from CS

- ▶ All metrics, domains, and program pairs
- ▶ Heatmaps with dendrograms
- ▶ Computing, engineering, sciences, cross-domain

<https://ransomts.github.io/ASEE-2026/>

Top Nested Relationships

High Overlap + Low Jaccard: one program's coursework is largely contained within another

Pair	Domain	Jaccard	TF-IDF	Overlap
Aerospace Eng. – Environmental Eng.	Eng.	8.2%	24.6%	90.3%
Textile Sci. – Environmental Eng.	Eng.	6.3%	2.6%	85.1%
Construction Tech. – Environmental Eng.	Eng.	6.8%	2.8%	80.9%

- ▶ Environmental Engineering's small course footprint is almost entirely shared with larger programs
- ▶ Low Jaccard because the larger programs have many additional courses

Intro & Context

Methodology

24 Results

Wrap Up

Top Parallel Relationships

Medium Jaccard + Low TF-IDF: shared foundational base, divergent specialization

Pair	Domain	Jaccard	TF-IDF	Overlap
Petroleum Eng. – Engineering Physics	Eng.	34.7%	2.7%	58.7%
Mechanical Eng. – Math	Cross-domain	35.9%	6.2%	57.3%
Computer Tech. – Engineering Physics	Eng.	32.6%	3.0%	49.3%

- ▶ Shared prerequisites and gen-ed courses drive moderate Jaccard
- ▶ Near-zero TF-IDF means their *identity-defining* coursework is completely different

Intro & Context

Methodology

25 Results

Wrap Up

Top Convergent Relationships

High Jaccard + High TF-IDF + High Overlap: deep structural alignment

Pair	Domain	Jaccard	TF-IDF	Overlap
Computer Eng. – Construction Eng. Tech.	Eng.	47.1%	55.3%	78.8%
Environmental Design – BA Env. Studies	Sciences	47.3%	45.8%	70.8%
Chemistry – BA Env. Studies	Sciences	46.1%	45.6%	72.0%

- ▶ These pairs share both the same courses *and* similar enrollment frequencies
- ▶ Often not grouped administratively despite deep curricular overlap

Key Takeaways

- ▶ STEM domains are interdisciplinary in *structurally different ways*
 - ▶ **Engineering**: parallel (shared core, divergent specialization)
 - ▶ **Computing**: nested hierarchies from CS
 - ▶ **Sciences**: cross-boundary clusters
- ▶ One-size-fits-all policy won't work

Intro & Context

Methodology

Results

28 Wrap Up

Practical Implications

Intro & Context

Methodology

Results

29 Wrap Up

- ▶ **Nested** ($IT \subset CS$): guide students toward parent field's electives
- ▶ **Parallel** (engineering): coordinate shared prerequisites
- ▶ **Convergent** (Aero $\approx$ Ind Eng): cross-listed courses, certificates, dual degrees

Future Work

- ▶ Disaggregate required vs. elective coursework
- ▶ Time series: are programs converging or diverging?
- ▶ Institutional disaggregation across universities
- ▶ Validate against known interdisciplinary programs
